

The Utility Problem

The work orders management tool is very important for utilities. Implemented work orders management tool in an organization offers several benefits, including:

- Organization and clarity - work orders provide a structured and standardized format for assigning and communicating tasks. They ensure that work descriptions, priorities, and instructions are clearly defined, minimizing confusion and misunderstandings.
- Efficient task management - work orders help streamline the workflow by providing a centralized system for managing and tracking tasks. They enable efficient allocation of resources, scheduling, and monitoring of work progress. Improved productivity - with clear instructions and priorities outlined in work orders, employees can focus on their assigned tasks without ambiguity. This leads to increased productivity and reduces time wasted on seeking clarification or unnecessary work.
- Accountability and responsibility - work orders establish accountability by clearly defining the assignee responsible for completing the task. It enables better tracking and monitoring of work progress, ensuring that tasks are completed within the specified timeframe.
- Record-keeping: The work orders management tool serves as a valuable information center, capturing important details such as task descriptions, completion dates, notes, images and resource requirements. They provide a historical record that can be referenced for future analysis, reporting, and auditing purposes.
- Preventive maintenance and asset management - in maintenance-related fields, work orders facilitate proactive maintenance planning. By scheduling routine inspections, repairs, or preventive maintenance tasks, organizations can avoid costly breakdowns, extend equipment lifespan, and optimize asset management.
- Compliance and regulatory adherence - work orders help organizations ensure compliance with industry regulations, safety protocols, and legal requirements. They can include specific instructions or guidelines to adhere to standards and promote a safe working environment.
- Cost control and budget management - work order management aid in cost control by capturing resource requirements and associated expenses. They provide visibility into labor, materials, and equipment needed for each task, enabling better budgeting and cost forecasting.

A properly functioning work order management tool increases operational efficiency, reduces errors and enables effective task and resource management.

The Data Solutions and Methods

Awesense's Energy Transition Platform offers simplified ways to work with work orders throughout the distribution area. Awesense Platform's unique integration of geospatial data (GIS), advanced asset information and unique work orders engine enable this type of capability.

Users with permissions can create work orders anywhere on the grid. Field technicians can see these orders. Each work order can be assigned to a specific user who will then be notified of this new work order. It is also possible to set different priorities for each work order and therefore determine which ones to start with.

The Awesense Energy Transition Platform offers visualization using True Grid Intelligence (TGI) software, and all work orders can be displayed directly in this interface. TGI includes a Work Orders page where orders are displayed:

- In the tabular form where all attributes of the orders are listed. Additional information includes data such as element ID, grid part, or the date the order was created;
- On the map, where the colour of the circle on the map indicates the priority of the order. This view is very useful not only for planning in the grid but also for the technician who knows right away where to go and how to plan a route for any other jobs on the grid.

TGI Work Orders are mainly for measuring IoT sensors - for installing and uninstalling them, collecting data, etc., but can of course also be used for other areas of workforce management.

Vital help for work order execution is the iOS application TGI Mobile. A lot of information can be displayed in the TGI Mobile app, which is particularly useful for technicians in the field. In the TGI Mobile app, it is possible to view all work orders, filter them, show only orders assigned to a specific technician, etc. Another benefit is handling sensors with this app - installing and uninstalling them, collecting data, etc. With the app, this process is very intuitive and helps technicians with proper execution. Other additional information is also displayed in the app.

After the work order completion, all executed work orders are centralized in the TGI application in one place and archived for future review, auditing and reporting.

Required Data Sets

The required data for this use case are visualized in the following diagram. Data sources highlighted in [royal blue](#) are required for this use case.

Available Use Case Implementations:

Users of the Awesense Energy Transition Platform can access this use case by the following means:

1. This use case is implemented in TGI as part of the Work Orders functionality. Consult [instructions](#) about how to access this use case in TGI. If you do not have access to a server where the use case functionality is available, contact [Awesense](#) to see a demo of it.
